

Syllabus for:

Parallel Computing for Science and Engineering

COE 379L, unique 15655

CSE 392, unique 65875

Victor Eijkhout

Spring 2026

Time and place	ETC 2.102, TueThu 15:30–17:00	
Instructor:	Victor Eijkhout	eijkhout@tacc.utexas.edu
Co-Instructor:	Zuzanna Jedlinska	
Co-Instructor:	Jack Gaither	
Office Hours:		Tue 14:00, ASE 5.224 or by appointment
TA:	TBD

1 Rationale; Course Aims and Objectives

Parallel computing has become the dominant method for achieving high performance in computational science, and engineering research and development. Computer systems containing from 10 to 100,000 CPUS, based on commodity processors from Intel, AMD, and IBM, are now commonplace in academia, government, and industry. Further parallelism derives from the high core count of the processor chips, or the use of SIMD/SIMT parallelism on graphics processors. Hence, parallel computing has become an important component of university curricula for scientists and engineers. (Parallel and concurrent computing is also an important topic in branches of computer science as different as web servers and operating system. Those typically have a very different flavor, and we will not go into them.)

This course is intended to teach the fundamentals of parallel programming for scientific and engineering applications. It includes the study of general parallel computing principles, including asymptotics; current computer architectures and how parallelism manifests itself in them. However, the main focus will be on acquiring active command in three of the main parallel programming systems in science and engineering: MPI (Message Passing Interface), OpenMP, and CUDA for GPU programming.

2 Format and Procedures

The course is structured around lectures, in-class labs, assignments (both theory and programming), quizzes, and one course project.

2.1 Tentative Course Schedule

The timetable will be roughly:

- 5 weeks of basic MPI
- 3 weeks of OpenMP
- 2 weeks introduction to CUDA
- 2 weeks of parallelism theory

The following topics will be taught, though not strictly in this sequence:

1. Overview of Parallel Computing. Parallel computing concepts, essentials of parallel computer architectures and hardware, and standard programming models for parallel computers. Account setup, hands-on introduction to large-scale system environments for development and execution of parallel applications.
2. Shared Memory Parallel Programming with OpenMP. OpenMP directives, syntax, and operation; parallelize serial codes with OpenMP; control and synchronization; performance issues, scalability, and new features of OpenMP.
3. Distributed Memory Programming with the Message Passing Interface (MPI) library. MPI communication operations and data structures, syntax and features; parallelizing serial codes with MPI, performance issues, future of MPI.

4. GPU Programming with CUDA. CUDA architecture and thread hierarchy; kernel functions and memory types; optimization techniques including memory coalescing and shared memory usage. Practice with basic parallel patterns and stencil computations.
5. Parallel Algorithm Design, Optimization, Hardware, and Scientific Applications Case Studies. The basics elements of parallel algorithm design, optimization and hardware operations for parallel programming will be presented.

2.2 Assignments and grading

The final grade is a weighted average of these components:

1. Homeworks
2. In-class quizzes
3. Project

Each of these section will have a different mix of assignments, in the form of theory exercises, programming exercises, or examination. For the programming part *count on one assignment per week*.

If this class is cross-listed as undergrad/grad, there may be two versions of some exercises, with graduate students obviously getting the harder version.

2.3 Programming Project

Exercises and assignments will typically only use a small part of the programming systems. Therefore, the semester concludes with a larger programming project that allows the student to show their skill in putting together a complete parallel application.

Requirements: Must be computational (not just academic theory), use parallel techniques/hardware, relevant to High Performance Computing. Students must first submit a proposal, to be approved by the instructor.

Students are expected to turn in code as well as a writeup. The project grade will be equally based on the quality of the code and the write-up. A style guide for project writeups will be provided.

1. The code needs to show the student's skill in parallel programming, so it needs to be largely written for this project. Consult with the instructor if in doubt. Use of pre-existing libraries is similar subject to approval by the instructor.
2. The writeup need to show the student's understanding of parallelism: discussion of expected and attained performance; factors influencing such; design decisions in the code.

The programming project takes the place of a final exam: it will be due on the last day of classes.

3 Assumptions and prerequisites

- Programming experience using at least one of C++/C/Fortran is required. Proficiency equivalent to SDS 322 or COE 322 is expected.
Not sufficient are: Java, Matlab, Python.
- Students need to be familiar with the basics of the Linux/Unix operating system.
- Familiarity with matrix linear algebra is necessary, for instance 408D or 408M; some familiarity with calculus and multi-variate calculus is desirable.
- Experience with developing scientific codes is helpful but not required. Each student is expected to employ one or more of the parallel concepts and develop a course project. For this it is acceptable to improve or add functionality to an existing research project. Otherwise, suggestions and guidance will be provided by the instructor.

4 Course Readings/Materials

All lecture slides and textbooks will be distributed through the repository <https://github.com/TACC/coe379spring2026>.

The following materials should be downloaded from the above Github location.

- *Parallel Computing for Science and Engineering*, Victor Eijkhout, is the textbook, covering MPI, OpenMP, CUDA.
- *Introduction to High-Performance Scientific Computing*, Victor Eijkhout, contains much background material on computer architectures and computing. The class will regularly refer to this book.

These books are by the class instructor; he greatly appreciates receiving comments and corrections on this text.

5 Instructors' Biographical Information

Victor Eijkhout is a Research Scientist in the High Performance Computing group at the Texas Advanced Computing Center (TACC). He has a doctoral degree in numerical analysis, and he has longtime experience in programming scientific codes and libraries, especially on parallel computers. His research interests include numerical linear algebra, parallel computing, machine learning, processor performance. He has written several widely used textbooks, as well as many scientific papers.

Zuzanna Jedlinska is a Research Associate in the High Performance Computing (HPC) group at TACC. She received her PhD in Physics from University of Pennsylvania. During her graduate work she focused on developing molecular dynamics software. At TACC, she focuses on GPU programming and performance optimization of software designed to run on GPUs.

Jack Gaither is an Engineering Scientist in the High Performance Computing Group at the Texas Advanced Computing Center. Jack's educational background is a Computer Science BS from the University of Arkansas at Fayetteville Engineering college. He is a recent addition to the HPC group but has been TACC staff for the past 4 years working for the user services team building experience supporting research on all of TACC's large scale systems. His research interests include computational fluid dynamics, high performance parallel computing, unstructured finite element work, oceanic and atmospheric simulation code.

6 Electronic resources

6.1 Class materials

Class materials, including syllabus, textbooks, lecture slides, will be disseminated through a github repository, see section 4.

Students are strongly recommended to learn minimal git commands, rather than to rely on a browser interface. Signing up for a github account and following this repository is also a good idea.

6.2 Discussion through Slack

Students will have access to a Slack workspace for discussions. The link will be given out through Canvas.

6.3 Zoom recording

Lectures will be recorded through Zoom (see the Zoom section in Canvas) and kept for availability through the end of the semester.

6.4 Computing Resources

Students are free to use personal computers and laptops (or machines belonging to any department they have access to) for developing codes. In that case they need a C/C++ or Fortran compiler with OpenMP and an MPI installation.

However, assignments will ultimately have to be performed on one of TACC's clusters.

If you don't already have a TACC account, go to <https://portal.tacc.utexas.edu/> and create an account there. Send a note through Canvas to the instructor(s) and TA(s) what login name is you have created. If you already have a TACC account, for instance through working with an advisor, mail us that.

6.5 Artificial Intelligence

The textbook and lecture notes provided should be enough information to do the homework exercises and prepare for quizzes. Still, it may be beneficial to find secondary information, or to see material presented from a different viewpoint. However, letting some AI do your work for you carries no such benefits. When confronted with particularly egregious examples the teachers may quiz you on your work to make sure you actually understand your submission.

6.6 Canvas

UT Canvas will be used for posting announcements and recording grades.

7 Formal and informal policies

Homework submission

Homeworks are to be submitted in a github repository.

1. Make sure you have a github account. Name it whatever you want, but this account will probably stick around for a long time, so don't make the name relate to TACC or this course.
2. Create a *private* repository and invite the instructors and TA to it as collaborators through a Canvas message.
3. When submitting homework, make sure to follow instructions as posted in Canvas.

Class attendance and participation policy

We expect students to attend and participate in class in accordance with the UT Honor Code (see below). Students are encouraged to ask questions, especially relating to material used in their projects.

This class will have lecture and lab sessions. During the lectures there are to be no laptops open, as these are distracting to the student, as well as others who can see the screen. Tablets with non-raised screens are allowed.

Academic Integrity

University of Texas Honor Code

The core values of The University of Texas at Austin are learning, discovery, freedom, leadership, individual opportunity, and responsibility. Each member of the university is expected to uphold these values through integrity, honesty, trust, fairness, and respect toward peers and community.

Each student in this course is expected to abide by the University of Texas Honor Code. Any work submitted by a student in this course for academic credit will be the student's own work. Collaborations will be allowed for the course project.

You are encouraged to study together and to discuss information and concepts covered in lecture and the sections with other students. You can give "consulting" help to or receive "consulting" help from such students. However, this permissible cooperation should never involve one student having possession of a copy of all or part of work done by someone else, in the form of an e-mail, an e-mail attachment file, a diskette, or a hard copy.

Should copying occur, both the student who copied work from another student and the student who gave material to be copied will both automatically receive a zero for the assignment. Penalty for violation of this Code can also be extended to include failure of the course and University disciplinary action.

During examinations, you must do your own work. Talking or discussion is not permitted during the examinations, nor may you compare papers, copy from others, or collaborate in any way. Any collaborative behavior during the examinations will result in failure of the exam, and may lead to failure of the course and University disciplinary action.

Religious Holy Days

By UT Austin policy, you must notify the instructors of your pending absence at least fourteen days prior to the date of observance of a religious holy day. If you must miss a class, an examination, a work assignment, or a project in order to observe a religious holy day, they will give you an opportunity to complete the missed work within a reasonable time after the absence.

Use of E-mail for Official Correspondence to Students

All students should become familiar with the University's official e-mail student notification policy. It is the student's responsibility to keep the University informed as to changes in his or her e-mail address. Students are expected to check e-mail on a frequent and regular basis in order to stay current with University-related communications, recognizing that certain communications may be time-critical. It is recommended that e-mail be checked daily, but at a minimum, twice per week. The complete text of this policy and instructions for updating your e-mail address are available at <http://www.utexas.edu/its/help/utmail/1564>.

Documented Disability Statement

Any student with a documented disability who requires academic accommodations should contact Services for Students with Disabilities (SSD) at (512) 471-6259 (voice)

or 1-866-329-3986 (video phone). Faculty are not required to provide accommodations without an official accommodation letter from SSD. (Note to Faculty: Details of a student disability are confidential. Faculty should not ask questions related to a student's condition or diagnosis when receiving an official accommodation letter.)

Please notify me as quickly as possible if the material being presented in class is not accessible (e.g., instructional videos need captioning, course packets are not readable for proper alternative text conversion, etc.).

Contact Services for Students with Disabilities for more disability-related information: <https://disability.utexas.edu/>.

Other absences

If you need an extension of deadlines or other accomodation because of sickness or other unforeseen circumstances, submit (or have submitted) a letter from the Office of the Dean of Students. Requests after the fact ('I have been sick for the last two weeks') will not be honored except in extreme cases.

Behavior Concerns Advice Line (BCAL)

If you are worried about someone who is acting differently, you may use the Behavior Concerns Advice Line to discuss by phone your concerns about another individual's behavior. This service is provided through a partnership among the Office of the Dean of Students, the Counseling and Mental Health Center (CMHC), the Employee Assistance Program (EAP), and The University of Texas Police Department (UTPD). Call 512-232-5050 or visit <http://www.utexas.edu/safety/bcal>.

Q drop Policy

The State of Texas has enacted a law that limits the number of course drops for academic reasons to six (6). As stated in Senate Bill 1231: Beginning with the fall 2007 academic term, an institution of higher education may not permit an undergraduate student a total of more than six dropped courses, including any course a transfer student has dropped at another institution of higher education, unless the student shows good cause for dropping more than that number.

Emergency Evacuation Policy

Occupants of buildings on the UT Austin campus are required to evacuate and assemble outside when a fire alarm is activated or an announcement is made. Please be aware of the following policies regarding evacuation:

- Familiarize yourself with all exit doors of the classroom and the building. Remember that the nearest exit door may not be the one you used when you entered the building.

- If you require assistance to evacuate, inform me in writing during the first week of class.
- In the event of an evacuation, follow my instructions or those of class instructors.
- Do not re-enter a building unless you are given instructions by the Austin Fire Department, the UT Austin Police Department, or the Fire Prevention Services office.
